

This medicinal product is subject to additional monitoring in Australia. This will allow quick identification of new safety information. Healthcare professionals are asked to report any suspected adverse events at [www.tga.gov.au/reporting-problems](http://www.tga.gov.au/reporting-problems).

## **AUSTRALIAN PRODUCT INFORMATION - DIACOMIT® (stiripentol)**

### **1 NAME OF THE MEDICINE**

DIACOMIT (stiripentol)

### **2 QUALITATIVE AND QUANTITATIVE COMPOSITION**

Stiripentol 250 mg and 500 mg capsule

Stiripentol 250 mg and 500 mg powder for oral suspension

Each capsule contains either 250 mg or 500 mg stiripentol as the active ingredient.

Each sachet contains either 250 mg or 500 mg stiripentol as the active ingredient.

Excipients with a known effect in powders for oral suspensions: aspartame and sugars.

Capsules contain no excipients with a known effect.

For the full list of excipients, see section [6.1 LIST OF EXCIPIENTS](#).

### **3 PHARMACEUTICAL FORM**

DIACOMIT 250 mg capsule appears as an opaque pink capsule of size 2 with self-locking closure, imprinted with “Diacomit 250 mg”.

DIACOMIT 500 mg capsule appears as a white capsule of size 0 with self-locking closure, imprinted with “Diacomit 500 mg”.

DIACOMIT 250 mg and 500 mg powder for oral suspension is a pale pink powder filled in a single dose sachet.

### **4 CLINICAL PARTICULARS**

#### **4.1 THERAPEUTIC INDICATIONS**

DIACOMIT is indicated for adjunctive treatment of generalised tonic-clonic and clonic seizures associated with severe myoclonic epilepsy in infancy (SMEI, also known as Dravet syndrome) in patients whose seizures are not adequately controlled with a benzodiazepine (usually clobazam) and valproate.

## 4.2 DOSE AND METHOD OF ADMINISTRATION

### *Dosage*

Prescriptions and treatment should be initiated by neurologists experienced in the diagnosis and management of epilepsy, with continuation of patient management by general paediatricians and practitioners when the initiating neurologist is unavailable.

### **General**

The dose of stiripentol is calculated on a mg/kg body weight basis.

It is recommended to split the daily dose in two or three daily intakes (totalling the daily recommended dose per kg and per day). The initiation of adjunctive therapy with stiripentol should be undertaken gradually using upwards dose escalation to reach the recommended dose of 50 mg/kg/day.

Stiripentol dosage escalation should be gradual, starting with 20mg/kg/day for 1 week, then 30mg/kg/day for 1 week. Further dosage escalation is age dependent:

- children less than 6 years should receive an additional 20 mg/kg/day in the third week, thus achieving the recommended dose of 50 mg/kg/day in three weeks;
- children from 6 to less than 12 years should receive an additional 10 mg/kg/day each week, thus achieving the recommended dose of 50 mg/kg/day in four weeks;
- children and adolescents 12 years and older should receive an additional 5 mg/kg/day each week until the optimum dose is reached based on clinical judgment.

The recommended dose of 50 mg/kg/day is based on the available clinical study findings and was the only dose of DIACOMIT evaluated in the pivotal studies (see Clinical Trials subheading under section [5.1 PHARMACODYNAMIC PROPERTIES](#)).

There are no clinical study data to support the clinical safety of stiripentol administered at daily doses greater than 50 mg/kg/day.

There are no clinical study data to support the use of stiripentol as monotherapy in Dravet syndrome.

### **Dose adjustments of other antiepileptics used in combination with stiripentol**

Despite the absence of comprehensive pharmacology data on potential drug interactions, the following advice regarding modification of the dose and dosage schedules of other anti-epileptic medicinal products administered in conjunction with stiripentol is provided based on clinical experience.

#### *Clobazam*

In the pivotal studies, when the use of stiripentol was initiated, the daily dose of clobazam was 0.5 mg/kg/day usually administered in divided doses, twice daily. In the event of clinical signs of adverse reactions or overdose of clobazam (i.e., drowsiness, hypotonia, and irritability in young children), this daily dose was reduced by 25% every week.

Approximately two to three fold increases in clobazam and fivefold increases in norclobazam plasma levels respectively have been reported with co-administration of stiripentol in children with Dravet syndrome.

#### *Valproate*

The potential for metabolic interaction between stiripentol and valproate is considered modest and thus, no modification of valproate dosage should be needed when stiripentol is added, except for clinical safety reasons. In the pivotal studies in the event of gastrointestinal adverse reactions such as loss of appetite, loss of weight, the daily dose of valproate was reduced by around 30% every week.

### **Effect of formulation**

The sachet formulation ( $C_{\max} = 7.32 \mu\text{g/ml}$ ) has a slightly higher  $C_{\max}$  than the capsules ( $C_{\max} = 5.99 \mu\text{g/ml}$ ) and thus the formulations are not bioequivalent. It is recommended that if a switch of formulations is required this is done under clinical supervision, in case of problems with tolerability (see section [5 PHARMACOLOGICAL PROPERTIES](#)).

### **Renal and hepatic impairment**

Stiripentol is not recommended for use in patients with impaired hepatic and/or renal function (see section [4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE](#)).

### **Method of Administration**

The capsule should be swallowed whole with a glass of water during a meal.

The powder should be mixed in a glass of water and should be taken immediately after mixing during a meal.

Stiripentol must always be taken with food as it degrades rapidly in an acidic environment (e.g. exposure to gastric acid in an empty stomach).

DIACOMIT should not be taken with milk or dairy products (yoghurt, soft cream cheese, etc.), carbonated drinks, fruit juice or food and drinks that contain caffeine or theophylline.

### **Drug discontinuation**

Antiepileptic drugs, including DIACOMIT, should be withdrawn gradually to minimise the potential for seizures or increased seizure frequency. In clinical trials in children with Dravet syndrome, dosages were gradually reduced over a period lasting at least one month.

In situation where rapid withdrawal of DIACOMIT is medically required, appropriate monitoring is recommended.

## **4.3 CONTRAINDICATIONS**

Hypersensitivity to the active substance or to any of the excipients.  
A past history of psychoses in the form of episodes of delirium.

## **4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE**

### ***Identified precautions***

The pivotal clinical evaluation of DIACOMIT was in children of 3 years of age and over with SMEI. Children under 3 years of age and adults were not studied in the pivotal trials therefore efficacy and safety for those populations were not established in the pivotal trials.

### **Drug interactions**

*Carbamazepine, phenytoin and phenobarbital*

Carbamazepine, phenytoin, and phenobarbital should generally not be used in conjunction with stiripentol in the management of Dravet syndrome.

Phenytoin and phenobarbital can significantly decrease the serum concentration of stiripentol. Stiripentol can significantly increase the serum concentration of carbamazepine, phenytoin, and phenobarbital. Furthermore, there is evidence that these drugs have the potential to worsen seizure activity in patients with Dravet syndrome, even though these drugs may have a role in a subset of patients with Dravet syndrome.

It is recommended that carbamazepine, phenytoin, and phenobarbital be used in conjunction with stiripentol only under expert supervision with appropriate monitoring.

#### *Clobazam and valproate*

The daily dosage of clobazam and/or valproate should be reduced according to the onset of side effects whilst on stiripentol therapy (see section [4.2 DOSE AND METHOD OF ADMINISTRATION](#)).

#### *Substances interfering with CYP enzymes*

Stiripentol is an inhibitor of the enzymes CYP1A2, CYP2C8, CYP2C19, CYP3A4, CYP2C9 and CYP2D6 and may markedly increase the plasma concentrations of substances metabolised by these enzymes and increase the risk of adverse reactions (see section [4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS](#)). In vitro data also suggest that STP induces the activity of CYP1A2 and CYP2B/3A, but the clinical relevance of this is uncertain. In vitro studies suggested that stiripentol phase 1 metabolism is catalysed by CYP1A2, CYP2C9, CYP2C19 and CYP3A4/5 and possibly other enzymes. Caution is advised when combining stiripentol with other substances that inhibit or induce one or more of these enzymes.

#### **Blood count**

Neutropenia may be associated with the administration of stiripentol, clobazam and valproate. Blood counts should be assessed prior to starting treatment with stiripentol. Unless otherwise clinically indicated, blood counts should be checked every 6 months.

#### **Neurologic/psychiatric**

Patients should be monitored for somnolence and drowsiness, particularly when stiripentol is used concomitantly with other central nervous depressant. An adjustment of the dosage of concomitant clobazam or other anti-epileptic drugs could be considered. Patients (or their parents or carers) should be advised to not operate machinery or drive.

Movement disorders including ataxia, hypotonia, tremor hyperkinesia, dysarthria and equilibrium disorders have been reported in patients treated with DIACOMIT for Dravet syndrome.

#### **Suicidal Ideation and Behaviour**

Suicidal ideation and behaviour have been reported in patients treated with antiepileptic agents in several indications.

All patients treated with antiepileptic drugs, irrespective of indication, should be monitored for signs of suicidal ideation and behaviour and appropriate treatment should be considered. Patients (or their parents or carers) should be advised to seek medical advice should signs of suicidal ideation or behaviour emerge.

### *Use in hepatic impairment*

#### **Liver function**

In patients newly prescribed stiripentol, raised  $\gamma$ GT (notably when combined with valproate) are observed with a common frequency, whilst abnormal liver function tests (increases in AST and/or ALT) are also reported with a rare frequency. Liver function ( $\gamma$ GT, AST and ALT levels) should therefore be assessed prior to starting treatment with stiripentol and, unless otherwise clinically indicated, should be checked every 6 months.

Stiripentol is primarily metabolised by the liver and primarily excreted by the kidney.

In the absence of specific clinical data in patients with impaired hepatic or renal function, stiripentol is not recommended for use in patients with impaired hepatic and/or renal function.

### *Use in renal impairment*

Stiripentol is primarily metabolised by the liver and primarily excreted by the kidney.

In the absence of specific clinical data in patients with impaired hepatic or renal function, stiripentol is not recommended for use in patients with impaired hepatic and/or renal function.

### *Use in the elderly*

No data are available

### *Paediatric use*

#### **Growth rate of children**

Due to the frequency of gastrointestinal adverse reactions to treatment with stiripentol and valproate (anorexia, loss of appetite, nausea, vomiting), the growth rate of children under this combination of treatment should be carefully monitored.

### *Effects on laboratory tests*

In the event of an abnormal blood count or liver function test finding, the clinical decision for continuing use or adjusting the dose of stiripentol in conjunction with adjusting the doses of clobazam and valproate needs to be made on an individual patient basis taking into consideration the potential clinical benefits and risks.

## **4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS**

Stiripentol is subject to non-linear pharmacokinetics (see section [5 PHARMACOLOGICAL PROPERTIES](#)).

### **Potential medicinal product interactions affecting stiripentol**

The influence of other antiepileptic medicinal products on stiripentol pharmacokinetics is not well established.

The impact of macrolides and azole antifungal agents, that are known to be inhibitors of CYP3A4 and substrates of the same enzyme, on stiripentol metabolism is not known. Likewise, the effect of stiripentol on their metabolism is not known.

*In vitro* studies suggested that stiripentol phase 1 metabolism is catalysed by CYP1A2, CYP2C19 and CYP3A4 and possibly other enzymes. Caution is advised when combining stiripentol with other substances that inhibit or induce one or more of these enzymes.

### **Effect of stiripentol on cytochrome P450 enzymes**

Many of these interactions have been partially confirmed by *in vitro* studies and in clinical trials. The increase in steady state levels with the combined use of stiripentol, valproate, and clobazam is similar in adults and children, though inter-individual variability is marked.

At therapeutic concentrations, stiripentol significantly inhibits several CYP450 isoenzymes: for example, CYP2C19, CYP1A2, CYP2C8, CYP2D6, CYP2C9 and CYP3A4. As a result, pharmacokinetic interactions of metabolic origin with other medicines may be expected. These interactions may result in increased systemic levels of these active substances that may lead to enhanced pharmacological effects and to an increase in adverse reactions. *In vitro* data also suggest that stiripentol induces the activity of CYP1A2 and CYP2B/3A, but the clinical relevance of this is uncertain.

Caution must be exercised if clinical circumstances require combining stiripentol with substances metabolised by CYP2C19 (e.g. citalopram, omeprazole) or CYP3A4 (e.g. HIV protease inhibitors, antihistamines such as astemizole and chlorpheniramine, calcium channel blockers, statins, oral contraceptives, codeine) due to the increased risk of adverse reactions (see further in this section for antiepileptic medicines). Monitoring of plasma concentrations or adverse reactions is recommended. A dose adjustment may be necessary.

Co-administration with CYP3A4 substrates with a narrow therapeutic index should be avoided due to the markedly increased risk of severe adverse reactions.

Data on the potential for inhibition of CYP1A2 are limited, and therefore, interactions with theophylline and caffeine cannot be excluded because of the increased plasma levels of theophylline and caffeine which may occur via inhibition of their hepatic metabolism, potentially leading to toxicity. Use in combination with stiripentol is not recommended. This warning is not only restricted to medicinal products but also to a considerable number of foods and nutritional products aimed at children, such as cola drinks, which contain significant quantities of caffeine or chocolate, which contains trace amounts of theophylline.

As stiripentol inhibited CYP2D6 *in vitro* at concentrations that are achieved clinically in plasma, substances that are metabolised by this isoenzyme like: beta-blockers (propranolol, carvedilol, timolol), antidepressants (fluoxetine, paroxetine, sertraline, imipramine, clomipramine), antipsychotics (haloperidol), analgesics (codeine, dextromethorphan, tramadol) may be subject to metabolic interactions with stiripentol. A dose-adjustment may be necessary for substances metabolised by CYP2D6 and that are individually dose titrated.

### **Effect of stiripentol on GABA receptor site**

Stiripentol is a positive allosteric modulator of the GABA<sub>A</sub> receptor. There is a potential for it to act synergistically with other allosteric modulators at the same site (e.g. benzodiazepines, non-benzodiazepines, barbiturates, bromides or neuroactive steroids) to enhance GABAergic neurotransmission.

### **Potential for stiripentol to interact with other medicinal products**

In the absence of available clinical data, caution should be taken with the following clinically relevant interactions with stiripentol:

<b>Drug or drug class</b>	<b>Clinical comment</b>
<i>Undesirable combinations (to be avoided unless strictly necessary)</i>	
Rye ergot alkaloids (ergotamine, dihydroergotamine)	Ergotism with possibility of necrosis of the extremities (inhibition of hepatic elimination of rye ergot).
Cisapride, halofantrine, pimozide, quinidine, bepridil	Increased risk of cardiac arrhythmias and torsades de pointes/wave burst arrhythmia in particular.
Immunosuppressants (tacrolimus, cyclosporine, sirolimus)	Raised blood levels of immunosuppressants (decreased hepatic metabolism).
Statins (atorvastatin, simvastatin, etc.)	Increased risk of dose-dependent adverse reactions such as rhabdomyolysis (decreased hepatic metabolism of cholesterol-lowering agent).
<i>Combinations requiring precautions</i>	
Midazolam, triazolam, alprazolam	Increased plasma benzodiazepine levels may occur via decreased hepatic metabolism leading to excessive sedation.
Chlorpromazine	Enhanced central depressant effect of chlorpromazine.

**Effects on other Anti-epileptic drugs (AEDs)**

<b>Concomitant antiepileptic drug</b>	<b>Clinical comment</b>
Phenobarbital, carbamazepine, phenytoin, primidone, clobazam, valproate, diazepam, ethosuximide, and tiagabine.	<p>Inhibition of CYP450 isoenzyme CYP2C19 and CYP3A4 may provoke pharmacokinetic interactions (inhibition of their hepatic metabolism) with phenobarbital, primidone, phenytoin, carbamazepine, clobazam, valproate (refer to section <a href="#">4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE</a>), diazepam (enhanced myorelaxation), ethosuximide, and tiagabine. The consequences are increased plasma levels of these anticonvulsants with potential risk of overdose.</p> <p>Phenytoin, phenobarbital, carbamazepine should not be used in conjunction with DIACOMIT in Dravet patients.</p> <p>Clinical monitoring of plasma levels of other anticonvulsants when combined with stiripentol with possible dose adjustments is recommended.</p>
Topiramate	In a compassionate use program for stiripentol, topiramate was added to stiripentol, clobazam and valproate in 41% of 230 cases. Based on the clinical

	<p>observations in this group of patients, there is no evidence to suggest that a change in topiramate dose and dosage schedules is needed if co-administered with stiripentol.</p> <p>With regard to topiramate, it is considered that potential competition of inhibition on CYP2C19 should not occur because it probably requires plasma concentrations 5-15 times higher than plasma concentrations obtained with the standard recommended topiramate dose and dosage schedules.</p>
Levetiracetam	Levetiracetam does not undergo hepatic metabolism to a major extent. As a result, no pharmacokinetic metabolic drug interaction between stiripentol and levetiracetam is anticipated.

CYP3A4 inhibitors, such as stiripentol, may increase the exposure of oestrogen or progestin containing contraceptives when used concomitantly. Oestrogen or progestin containing contraceptives may increase the exposure of CYP1A2 or CYP3A substrates, such as stiripentol. The clinical significance of these potential interactions is not known.

#### 4.6 FERTILITY, PREGNANCY AND LACTATION

##### *Effects on Fertility*

There were no effects on fertility in male and female rats following oral administration of STP at doses up to 800 mg/kg/day (equivalent to about 3-fold the MRHD, based on body surface area). As no human clinical data are available, the potential risk for humans is unknown.

##### *Use in Pregnancy (Category B3)*

##### **Risk related to epilepsy and antiepileptic medicinal products in general**

It has been shown that in the offspring of women with epilepsy, the prevalence of malformations is two to three times greater than reported in the general population. Although other factors, e.g. the epilepsy, can contribute, available evidence suggests that this increase, to a large extent, is caused by the treatment. In the treated population, an increase in malformations has been noted with polytherapy.

However, effective anti-epileptic therapy should not be interrupted during pregnancy, since the aggravation of the illness may be detrimental to both the mother and the foetus.

##### **Risk related to stiripentol**

No data on exposed pregnancies are available. Stiripentol and/or its metabolites cross the placenta in rats. There was no evidence of teratogenicity in mice or rabbits treated with STP during the period of organogenesis at oral doses up to 800 mg/kg/day, which is about 2-fold (mice) and 6-fold (rabbits) the MRHD, based on body surface area. Increased numbers of resorptions were reported in mouse embryofetal development studies at doses of  $\geq 200$  mg/kg/day (0.4 times the MRHD based on BSA), and also in the rabbit embryofetal development study at a dose of 800 mg/kg/day (6 times the MRHD based on BSA). Rats

treated with oral STP from early or late gestation to weaning showed maternotoxicity and reduced pup survival and reflex development at 800 mg/kg/day (equivalent to about 3-fold the mg/m<sup>2</sup> MRHD); the no-effect dose was 200 mg/kg/day.

In view of the indication, administration of stiripentol during pregnancy and in women of childbearing potential would not be expected. The clinical decision for use of stiripentol in pregnancy needs to be made on an individual patient basis taking into consideration the potential clinical benefits and risks. Caution should be exercised when prescribing to pregnant women and use of efficient methods of contraception is advisable.

***Use in Lactation***

It is not expected that Dravet syndrome affected women will conceive and have children. However, as there are no human studies on the excretion of stiripentol in breast milk, and given that stiripentol passes freely from plasma into milk in the goat, breast feeding is not recommended while on treatment with stiripentol. In the unlikely event that stiripentol therapy is maintained while breast feeding, the breast fed infant should be carefully monitored for potential adverse effects.

**4.7 EFFECTS ON ABILITY TO DRIVE AND USE MACHINES**

Patients with Dravet syndrome would not be expected to drive or operate machinery due to the nature of the underlying disease and the effects of long term administration of anticonvulsant medicines.

Stiripentol may cause dizziness and ataxia that may affect ability to drive and use machines and patients should not drive or use machinery whilst on stiripentol therapy.

**4.8 ADVERSE EFFECTS (UNDESIREABLE EFFECTS)**

***Summary of the safety profile***

**Clinical trial experience**

Two prospective, randomised, 8-week treatment, double-blind, placebo-controlled trials were conducted in Dravet syndrome patients (STICLO France and STICLO Italy). In both trials, stiripentol was added on to treatment with valproate and clobazam. The dose of stiripentol was 50 mg/kg/day.

The following table lists the adverse events that were reported during the studies. No patient died during these double-blind, placebo-controlled studies.

**Table 1 Number and percentage of patients with Dravet syndrome who experienced adverse events in double-blind placebo-controlled clinical studies in which stiripentol (STP) was used as an adjunct treatment with valproate and clobazam**

Body System / Adverse event	STICLO France		STICLO Italy		STICLO Pooled Total	
	STP N = 21	Placebo N = 20	STP N = 12	Placebo N = 11	STP N = 33	Placebo N = 31

### ***Tabulated list of adverse reactions***

#### **Post marketing experience**

The most common side effects with DIACOMIT (seen in more than 1 in 10 patients) are anorexia, weight loss, insomnia, drowsiness, ataxia, hypotonia and dystonia.

Adverse effects encountered most often are as follows: very common ( $\geq 1/10$ ), common ( $\geq 1/100$  to  $< 1/10$ ), uncommon ( $\geq 1/1,000$  to  $< 1/100$ ), rare ( $\geq 1/10,000$  to  $< 1/1,000$ ), very rare ( $< 1/10,000$ ), not known (cannot be estimated from the available data). Within each frequency grouping, adverse effects are presented in order of decreasing severity. These data are presented in Table 2.

**Table 2 Tabulated list of DIACOMIT Adverse Effects**

System Order Class	Very Common	Common	Uncommon	Rare
Blood and lymphatic system disorder		Neutropenia Persistent severe neutropenia usually resolves spontaneously when Diacomit is stopped.		Thrombocytopenia*
Metabolism and nutrition disorders	Anorexia, loss of appetite, weight loss (especially when combined with sodium valproate)			
Psychiatric disorder	Insomnia	Aggressiveness, irritability, behaviour disorders, opposing behaviour, hyperexcitability, sleep disorders		
Nervous system disorders	Drowsiness, ataxia, hypotonia, dystonia	Hyperkinesias		
Eye disorders			Diplopia (when used in combination with carbamazepine)	
Gastrointestinal disorders		Nausea, vomiting		
Skin and subcutaneous tissue disorders			Photosensitivity, rash, cutaneous allergy, urticaria	
General disorders and administration site conditions			Fatigue	
Investigations		Raised $\gamma$ GT (notably when combined with carbamazepine and valproate)		Liver function test abnormal

Many of the above adverse reactions are often due to an increase in plasma levels of other anticonvulsant medicinal products (see section [4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE](#) and section [4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS](#)) and may regress when the dose of these medicinal products is reduced.

\*Thrombocytopenia data are derived from both clinical trials and post-marketing experience.

### **Gastrointestinal adverse events**

#### *Weight loss and anorexia*

Anorexia and weight loss are very common adverse effects.

In two double-blind, placebo-controlled trials in Dravet syndrome patients, gastrointestinal adverse events most often reported in patients receiving stiripentol were loss of appetite in 39% of the treated patients and loss of weight in 24% of the treated patients.

*Nausea and vomiting*

Nausea and vomiting are common adverse effects.

In 2 double-blind, placebo-controlled trials in Dravet syndrome patients, nausea and vomiting were observed in 15% of the treated patients.

Due to the frequency of gastrointestinal adverse reactions to treatment with stiripentol and valproate (anorexia, loss of appetite, nausea, vomiting), the growth rate of children under this combination of treatment should be carefully monitored.

*Abnormal liver function tests*

Raised  $\gamma$ GT (notably when combined with carbamazepine and valproate) is a common adverse effect.

Liver function should be assessed prior to starting treatment with stiripentol. Unless otherwise clinically indicated, liver function should be checked every 6 months. As the drug is metabolised mainly by the liver, stiripentol is not recommended for use in patients with impaired hepatic function.

**Central nervous system adverse events**

Drowsiness, ataxia, hypotonia, dystonia and insomnia are very common adverse effects.

In 2 double-blind, placebo-controlled trials in Dravet syndrome patients, drowsiness/sleepiness were observed in 67% of the treated patients, hyperexcitability/agitation in 21% of treated patients, aggressiveness/irritability in 15% of treated patients, hypotonia in 15% of the treated patients, and ataxia in 12% of the treated patients.

Patients should be monitored for somnolence and drowsiness, particularly when stiripentol is used concomitantly with other central nervous depressant. An adjustment of the dosage of concomitant clobazam or other anti-epileptic drugs could be considered. Patients should be advised to not operate machinery or drive.

**Thrombocytopenia and neutropenia**

Neutropenia is a common adverse effect. Thrombocytopenia is a rare adverse effect.

In 2 double-blind, placebo-controlled trials in Dravet syndrome patients, neutropenia was observed in 9% of the treated patients and thrombocytopenia in 6% of the treated patients.

Blood counts should be assessed prior to starting treatment with stiripentol. Unless otherwise clinically indicated, blood counts should be checked every 6 months.

***Reporting suspected adverse effects***

Reporting suspected adverse reactions after registration of the medicinal product is important. It allows continued monitoring of the benefit-risk balance of the medicinal product.

Healthcare professionals are asked to report any suspected adverse reactions at [www.tga.gov.au/reporting-problems](http://www.tga.gov.au/reporting-problems).

## 4.9 OVERDOSE

Data on clinical overdose are not available. Treatment is supportive (symptomatic measures in intensive care units).

For information on the management of overdose, contact the Poison Information Centre on 131126 (Australia) or the New Zealand Poisons Centre on 0800 POISON or 0800 764 766.

## 5 PHARMACOLOGICAL PROPERTIES

Pharmacology data are mainly based on four clinical pharmacokinetics studies in healthy adult volunteers, one population pharmacokinetics study in children with Dravet syndrome, three efficacy studies in the target population that generated supportive pharmacokinetics data and studies from the clinical literature.

### 5.1 PHARMACODYNAMIC PROPERTIES

#### *Mechanism of action*

The mechanism of antiepileptic activity of stiripentol is based on the potentiation of the GABAergic transmissions in the CNS. *In vitro*, stiripentol has been shown to directly enhance GABA<sub>A</sub> receptor-mediated transmission by acting both post-synaptically at a neuronal site coupled to the GABA<sub>A</sub> receptor and pre-synaptically to increase GABA release from nerve terminals. In rodent models, stiripentol appears to increase brain levels of GABA. This could occur by inhibition of synaptosomal uptake of GABA and/or inhibition of GABA transaminase. Stiripentol has been shown to enhance GABA<sub>A</sub> receptor-mediated transmission in the immature rat hippocampus and increase the mean open-duration (but not the open-frequency) of GABA<sub>A</sub> receptor chloride channels.

Stiripentol also potentiates the efficacy of clobazam and other anticonvulsants, as a result of the pharmacokinetic interactions (see section [4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS](#)). This effect of stiripentol is mainly based on metabolic inhibition of several isoenzymes, in particular CYP450 3A4 and 2C19, involved in the hepatic metabolism of other anti-epileptic medicines.

#### *Clinical Trials*

The efficacy of stiripentol, as an add-on therapy to optimised treatment with valproate and clobazam in patients presenting with Dravet syndrome has been demonstrated in two randomised, double-blind, placebo-controlled clinical trials. These trials, designated STICLO France and STICLO Italy, involved 41 (age range: 3.0-20.7) and 23 patients (age range: 3.5-18.9) respectively. Both studies were conducted according to similar design to evaluate the responder rate to treatment, where the responder was defined as a patient who achieved  $\geq$  50% decrease in the frequency of generalised clonic or tonic-clonic seizures during the double-blind treatment period compared to baseline (i.e., placebo run-in).

Eligible patients were included initially in a 1-month baseline period during which they continued to receive their optimised antiepileptic treatment. Following this 1-month baseline, patients were randomly allocated to receive either stiripentol (50 mg/kg/day) or placebo added on to their antiepileptic treatment. The frequency of generalised clonic or tonic-clonic seizures during the trial was recorded by the patients and or their caregivers, using a diary. Patients were treated double-blind for 2 months.

Results of each clinical trial are presented separately as well as pooled. Several criteria allow to pool the results of STICLO France and STICLO Italy. The data poolability from the two STICLO trials was assessed statistically and results indicated that the data were poolable using the demographic and primary endpoints data.

In study STICLO France, total of 41 patients were enrolled; 21 were randomised to receive stiripentol and 20 were randomised to receive placebo. One patient in the stiripentol group was excluded. For study STICLO Italy, 23 patients were enrolled; 12 were randomised to STP, and 11 to placebo. All were judged to be evaluable. A summary of the baseline demographic data is provided in Table 3.

<b>Responder analysis<sup>†</sup></b>						
No of responders/total (Responder rate)	15/21 (71.4%)	1/20 (5.0%)	8/12 (66.7%)	1/11 (9.1%)	23/33 (69.7%)	2/31 (6.5%)
[95 % CI]	[52.1 – 90.8]	[0.0 – 14.6]	[40.0 – 93.3]	[0.0 – 26.1]	[54.0 – 85.4]	[0.0 – 15.1]
p-value <sup>2</sup>	< 0.0001		0.0098		<0.0001	

\*: Frequency of generalised tonic-clonic or clonic seizures.

†: Responder is defined as a patient with a ≥ 50% decrease in frequency of generalised tonic-clonic or clonic seizures.

[1] Wilcoxon Test; [2] Fisher’s Exact Test.

CI=confidence interval; SD=standard deviation.

In both STICLO trials, stiripentol was significantly more efficacious than placebo, as determined by response rate (refer to Table 4). In STICLO France, 15 of 21 (71.4%) patients on STP *versus* 1 of 20 (5.0%) patients on placebo met the criterion for response (≥ 50% reduction in generalised tonic-clonic seizure frequency); the difference between treatment groups was statistically significant ( $p < 0.0001$ ). In STICLO Italy, 8 of 12 (66.7%) patients randomised to STP *versus* 1 of 11 (9.1%) patients randomised to placebo met the criterion for response; the difference between treatment groups was statistically significant ( $p=0.0098$ ). In both STICLO trials, STP was also superior to placebo as judged by mean percent reduction in frequency of generalised clonic or tonic-clonic seizures (STICLO France:  $p=0.0003$ ; STICLO Italy:  $p=0.0056$ ).

When efficacy results of both STICLO trials were pooled, 23 of 33 (69.7%) patients on stiripentol *versus* 2 of 31 (6.5%) patients on placebo met the criterion for response ( $p < 0.0001$ ). Mean percent reduction in seizure frequency was 66% in the pooled STP group *versus* an increase of 4% in the pooled placebo groups ( $p < 0.0001$ ).

## 5.2 PHARMACOKINETIC PROPERTIES

Studies in children of various ages showed that the pharmacokinetic behaviour of stiripentol is influenced by age and body weight. Stiripentol should be adjusted accordingly by reducing the daily dose as body weight and age increase.

### *Absorption*

Stiripentol is quickly absorbed. The  $T_{max}$  times were 2.42 hours for single doses of stiripentol 500 mg and 1,000 mg and 2.96 hours for 2,000 mg. According to Michaelis-Menten kinetics there is some evidence for non-linearity regarding stiripentol absorption. Following the oral administration of 500 mg, 1,000 mg and 2,000 mg of stiripentol in healthy volunteers the following data were determined.

	500 mg	1,000 mg	2,000 mg
$C_{max}$ (mg/L)			
Mean $\pm$ SD	2.63 $\pm$ 1.18	6.63 $\pm$ 1.83	13.8 $\pm$ 4.83
Median	2.14	6.50	14.1
Min-max	1.21 – 4.91	3.90 – 10.4	8.31 – 24.0
AUC <sub>0-30h</sub> (mg/L.h)			
Mean $\pm$ SD	8.85 $\pm$ 3.77	32.1 $\pm$ 10.7	79.0 $\pm$ 24.2
Median	8.13	30.2	82.0
Min-max	3.74 – 15.7	18.3 – 51.1	48.2 - 128

The absolute bioavailability of stiripentol is not known since an intravenous formulation is not available for testing. It is well absorbed by the oral route since the majority of an oral dose is excreted in urine. Relative bioavailability between the capsules and powder for oral suspension in sachet formulations has been studied in healthy male volunteers after a 1,000 mg single oral administration.  $C_{max}$  of the sachet was slightly higher (23%) compared with the capsule and did not meet the criteria for bioequivalence.  $T_{max}$  was similar with both formulations. Clinical supervision is recommended if switching between the stiripentol capsule and powder for oral suspension in sachet formulations.

### *Distribution*

Stiripentol binds extensively to circulating plasma proteins (about 99% at clinical plasma concentrations).

In a population pharmacokinetic study conducted in Dravet syndrome patients at steady state receiving the combination valproate + clobazam + stiripentol, the apparent volume of stiripentol distribution according to weight was as follows.

Body weight (kg)	V/F (L)
10	32.0 $\pm$ 3.8
30	95.9 $\pm$ 11.5
60	191.8 $\pm$ 23.0

### *Metabolism*

Stiripentol is primarily metabolised by the liver.

Stiripentol undergoes extensive first-pass metabolism in the liver with CYP1A2, CYP2C19 and CYP3A4 being the main isozymes involved in stiripentol metabolism. Stiripentol is mainly metabolised by glucuronidation and oxidative cleavage.

Stiripentol is supplied as a racemic mixture, and after administration R-enantiomer is the predominant enantiomer, but glucuronidation appears to favour the S-enantiomer. Elimination of a single dose was mainly (73%) via the kidney after extensive metabolism (13 different metabolites) by the liver (Cytochrome P 450).

### ***Excretion***

Stiripentol is primarily excreted by the kidney.

Systemic exposure to stiripentol increases markedly compared to dose proportionality. In healthy adults, plasma clearance decreases markedly at high doses; it falls from approximately 40 l/kg/day at the dose of 600 mg/day to about 8 l/kg/day at the dose of 2,400 mg. Clearance is decreased after repeated administration of stiripentol, probably due to inhibition of the cytochrome P450 isoenzymes responsible for its metabolism. The half-life of elimination was in the range of 4.5 hours to 13 hours, increasing with dose.

Similarly, in a population pharmacokinetic study conducted in Dravet syndrome patients at steady state receiving the combination valproate + clobazam + stiripentol, the apparent volume of stiripentol distribution according to weight was as follows.

<b>Body weight (kg)</b>	<b>CL/F (L/h)</b>	<b>T<sub>1/2</sub> (h)</b>
10	2.60 ± 0.18	8.5 ± 1.3
30	4.19 ± 0.29	15.9 ± 2.4
60	5.65 ± 0.40	23.5 ± 3.5

## **5.3 PRECLINICAL SAFETY DATA**

### ***Genotoxicity***

There was no evidence for genotoxic potential in *in vitro* assays for gene mutation or unscheduled DNA synthesis. A positive *in vitro* chromosomal aberration assay in Chinese Hamster Ovary cells (observed at the highest concentration) was not confirmed in a similar assay with human lymphocytes or in a mouse micronucleus test *in vivo*. The genotoxic potential of STP is considered to be low.

### ***Carcinogenicity***

There was no evidence of carcinogenicity in rats following oral administration of STP for 2 years at doses up to 800 mg/kg/day. This dose is approximately 3-4 times the MRHD based on body surface area, and systemic exposure (plasma AUC) was about 4-fold the estimated exposure in adults at the MRHD. In mice treated orally for 78 weeks, there was an increase in the incidence of hepatic adenomas and carcinomas at doses of 200 or 600 mg/kg/day. These doses are about 0.5 to 2-fold the MRHD based on body surface area, and plasma exposure was about 2-fold the paediatric C<sub>max</sub>; the no-effect dose was 60 mg/kg/day. In view of the lack of genotoxicity of STP and the known susceptibility of the mouse liver to tumour formation in response to hepatic enzyme induction, this finding is not considered to indicate a risk of tumorigenicity in patients.

## **6 PHARMACEUTICAL PARTICULARS**

### **6.1 LIST OF EXCIPIENTS**

**Capsules:**

Povidone  
Sodium starch glycolate type A  
Magnesium stearate  
Gelatin  
Titanium dioxide  
Erythrosine (DIACOMIT 250 mg only)  
Indigo carmine (DIACOMIT 250 mg only)

**Printing Ink:**

Shellac  
Iron oxide black

**Powder for oral suspension:**

Aspartame  
Spray-dried liquid glucose  
Povidone  
Sodium starch glycolate type A  
Erythrosine  
Titanium dioxide  
Carmellose  
Hyetellose  
Arome Polv Tutti Frutti 25 H 245

## 6.2 INCOMPATIBILITIES

Refer to section [4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS](#).

## 6.3 SHELF LIFE

In Australia, information on the shelf life can be found on the public summary of the Australian Register of Therapeutic Goods (ARTG). The expiry date can be found on the packaging.

## 6.4 SPECIAL PRECAUTIONS FOR STORAGE

Store below 25°C. Store in original container to protect from light.

## 6.5 NATURE AND CONTENTS OF CONTAINER

DIACOMIT 250 mg and 500 mg capsules are supplied in high density polyethylene bottles with tamper-evident seal and child-resistant polypropylene screw cap. Each bottle contains 60 capsules.

DIACOMIT 250 mg and 500 mg powder for oral suspension are packaged in paper/aluminium/high density polyethylene film sachet. The sachets are supplied in boxes of 60 sachets.

## 6.6 SPECIAL PRECAUTIONS FOR DISPOSAL

In Australia, any unused medicine or waste material should be disposed of in accordance with local requirements.

## 6.7 PHYSICOCHEMICAL PROPERTIES

Stiripentol is a white to pale yellow crystalline powder, practically insoluble in water at 25 °C, sparingly soluble in chloroform and soluble in acetone, ethanol, ether, acetonitrile and dichloromethane.

### *Chemical structure*

\*: identifies an asymmetric carbon.

### *CAS number*

49763-96-4

### *Molecular Formula*

Molecular formula: C<sub>14</sub>H<sub>18</sub>O<sub>3</sub>

Relative molecular mass: 234.3 g/mol

Stiripentol is obtained as a racemate.
